"The Effect of Vaccination on the Incidence of Whooping Cough among Preschool Children Within the Jurisdiction of the Third Children's Dispensary in the Opstina of Savski Venac in Belgrade."

Belgrade, Narodno Zdravlje, Vol 19, No 7-8, 1963, pp 258-260.

Abstract: The author discusses the nature of whooping cough and then records the experiences of her dispensary over a period of eight years (1955-1963). There were 195 cases on the average per year in the period 1955-1958 before the vaccine became available, 38 per year in the period 1958-1960 as the vaccine came into use, 15 cases in 1961, and four cases in 1962. Incidence in recent years has been in children who had not been vaccinated or who had been only partially vaccinated.

Title : A New Modification of the Loewenstein Medium for Growing
Cultures of Tuberculosis Bacteria taken from Pathological
Material.

Orig Pub : Acta Med. jugoslav., 1956, 10, No 3, 327-336.

Abstract : A small quantity of liquid Loewenstein-Jensen medium was
poured into a test-tube with a precipitate acquired by
homogenization and centrifugation of pathological mate-
rial. When the mixture had been kept for one week in a
thermostat, microcolonies of tuberculosis bacteria were
discovered in the smears. There were about 50% as many
positive results as when the culture was grown for 8
weeks on a solid Loewenstein-Jensen medium; after two

"Laboratory Service in Anti-tuberculosis Institutions in Serbia During the Period 1958-1961."

Belgrade, Narodno Zdravlje, Vol 19, No 4, 1963, pp 128-135.

Abstract: The author assesses anti-tuberculosis laboratory work in the light of statistics and of norms proposed by his institute and finds that the number of laboratory examinations was rising in absolute terms but that the number remained less than half than desirable under the norm (Belgrade and the Vojvodina being in a better position), that the cultivation of tuberculosis material was only 17 percent of the norm, and that the laboratories of the anti-tuberculosis institutions are relatively well equipped to the extent that equipment cannot be considered the reason why the volume of laboratory work is not up to standards. The author suggests more training and a more specific division of labor in this field. Tables, charts, no references.

"Examination of Workmen Exposed to Electromagnetic Waves of One Meter and Longer Length in the Region of West Bohemia."

Prague, Pracovni Lekarstvi, Vol 18, No 3, Apr 66, pp 100 - 106

Abstract /Authors' English summary modified/: 68 workmen employed in areas of electromagnetic fields with frequencies of 2.4 to 2.4 cycles, and wave lengths 3.5 to 30 meters were investigated. 52 were subjected to an uninterrupted field, and 16 to a polyfrequency interrupted field. 23% in the first, and 50% in the second group were influenced by the field. Only in one a serious disease resulted; most suffered simply from headache, fatigue, vegetative symptoms and lack of coordination of the cortex and mesodiencephalic CNS functions. 6 Figures, 2 Tables, 4 Western, 14 Czech references. Title: Proportions of Formic Acid, Dry Residue, Alcohol and Total Acids in Blackberry Juice During Fermentation

Original

Publication: Tehnika, 1956, 11, No 7, 1072-1075

Abstract: It was found that the content of formic acid (I) added for preservation of the juice, decreases during fermentation and no direct correlation is observed between the above-stated phenomenon and changes in the content of dry residue, alcohol and total acids in the fermenting juice. Addition of I in an amount of 0.5% does not stop the fermentation process. The mechanism of reactions which cause the decrease in the content of I has not been elucidated. Summative content of dry residue and alcohol remains practically unchanged during fermentation.

3.1. - A ~~REPORTA MEDICA~~ Sec 2 Vol 11/7 Physiology July 58

2970. DISTRIBUTION OF DNA AND RNA IN DIFFERENT REGIONS OF CAT'S BRAIN - Mihailović Jl., Janković B. D., Petković M. and Mancić D. Inst. of Path. Physiol., Med. Sch., Microbiol. Inst., Sch. of Pharmacy, Univ. of Belgrade, Belgrade - EXPERIENTIA (Basel) 1958, 14/1 (9-10) Tables 1

The quantity of DNA was of the same order in 13 different regions of the brain, including the grey and white matter. The RNA content was much more variable and lowest in white matter. This is related to functional differences between the areas studied.

Carbonization of a charge composed of imported coking coals with addition of various amounts of local brown coal, with an enriched lignite and native coal from Rasa deposit. The possibility was demonstrated for a wide application of Yugoslavian brown coals in the charge, the carbonization aiming at a preparation of quality coke.

TITLE	:	Studies on the Dyeing of Sulfite Cellulose Ground to Varying Degrees of Fineness	
ORIG. PUB.	:	Kemija u Industriji, 8, No 3, 70-72 (1959)	
ABSTRACT	:	Results are presented from work on the dyeing of bleached and unbleached sulfite cellulose with direct, acid, and basic dyes (D), using cellulose ground to different degrees of fineness and different D concentrations in the bath. The dyeing was carried out with and without the addition of resinous sizine materials, particularly sodium resinate. Best results were obtained when direct D were used, followed by acid and basic D.
